

## Sakura Demonstration Conmurra & Frances

### Sakura will offer South East farmers:

- Unprecedented levels of weed control and reliability from a pre-emergent herbicide in wheat, triticale and barley crops
- Unparalleled control (up to 95%) of herbicide-resistant annual ryegrass
- Highly effective control of other key weeds such as barley grass, annual phalaris, silver grass and toadrush
- The flexibility of a 14-day window of application
- Ease of use from a high concentration WG formulation
- A low rate of application, only 118 grams/hectare
- Exceptional residual control of some weeds
- Excellent performance even with moderate stubble loads, with a low risk of binding to crop stubble/plant residue
- Another effective pre-emergent herbicide solution to counter growing cross-resistance issues in grass weeds, especially annual ryegrass

Sakura also fits into an Integrated Weed Management (IWM) conservation farming approach, which is a priority for Australian farmers.

An application for registration of Sakura Herbicide has been made.
